

Hear it from the Experts!

“ We found that ELISA kits had superior sensitivity when compared to RDTs . ”

Source: Evaluation of Dengue NS 1 rapid tests and ELISA kits using clinical samples. Pal S, Dauner AL, Mitra I, Forshey BM, Garcia P, Morrison AC, et al., PLoS One. v9(11); 2014.

“ Dengue NS1 antigen ELISA is very useful & specific tool in diagnosing cases of acute dengue infection but when combined with IgM antibody ELISA, it can significantly improve diagnostic efficacy in dengue infection. This can definitely help resource-limited countries like India which experiences outbreak annually and it is a seasonal trend.”

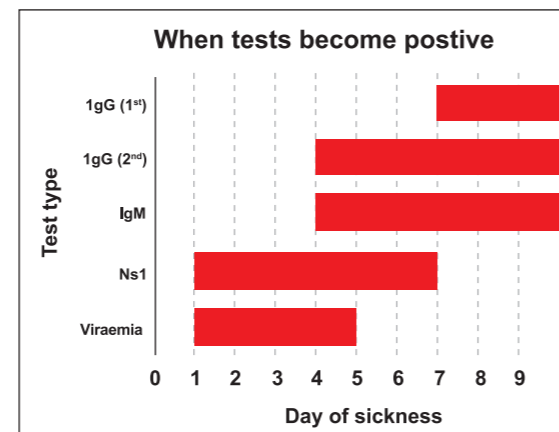

Source: Evaluation of NS1 antigen-capture ELISA and IgM antibody capture ELISA in acute cases of dengue in rural population in a tertiary care teaching hospital in western Uttar Pradesh, India. Rajesh Kumar Verma*, Dharmendra Prasad Singh, Sunita Kumari and ME Siddique, Department of Microbiology, UPRIMS&R, Saifai, Etawah (UP), India. IJPSR.0975-8232. 7(4). 1780-84.

“The Dengue IgG Cap-ELISA & IgM Cap-ELISA test has superior intensity of performance over the immunochromatographic tri-line rapid.”

Source: The sensitivity comparison of Immunodiagnostic assays for diagnosing dengue fever. Muhammad Zahoor, Haji Bahadur, Salah Uddin, Sumaira Naz. Korean J Clin Lab Sci. 2016; 48(4):275-279.

Early indicators of infection

- Dengue NS1 Ag is the first seromarker that can be detected from **DAY 1** of the infection.
- IgG and IgM can be detected from **DAY 5-7**.
- NS1 and/or IgM Ab indicate recent infection while presence of only IgG antibody is associated with chronic or later stage of dengue.

Efficient Testing with Smart Technology

Combat Dengue early on!

ErbaLisa® Dengue ELISA is a complete portfolio for early, reliable and accurate detection of Dengue seromarkers NS1 Ag, IgG and IgM.

ErbaLisa® Dengue NS1 Ag

Qualitative ELISA for detection of dengue NS1 Ag.

Shortest assay time of 75 minutes

- Early detection of NS1 Ag by Sandwich ELISA method
- Highest Sensitivity (100%) and Specificity (100%)

ErbaLisa® Dengue IgM μ-Capture

Qualitative ELISA for detection of dengue IgM.

Trusted μ-Capture method offers greater precision

- Assay time of 120 minutes
- Highest Sensitivity (100%) and Specificity (100%)

ErbaLisa® Dengue IgG Capture

Qualitative ELISA for detection of dengue IgG.

Trusted Immocapture method offers greater precision

- Assay time of 120 minutes
- Highest Sensitivity (100%) and Specificity (99.4%)

The ErbaLisa® Advantage

- Simple protocol
- Easy interpretation of results based only on cut-off value
- Breakaway Microwells
- Ready-to-use reagents
- Prolonged shelf life - 18 months at 2-8°C

False Positive Results with Dengue Serological Tests: A Problem

Serological tests can yield false positive results due to cross-reactions with other Flaviviruses (eg. Chikangunya), other pathogens causing fever (e.g. Plasmodium, Leptospira) and immune disorders such as Rheumatoid Arthritis.

As shown in a WHO evaluation study, the instances of false positive results in which a non-Dengue infected person is diagnosed as positive was as high as 31% in the kits from other manufacturers used in the study.

ErbaLisa Dengue ELISA kits have a documented specificity of 100% for both NS1 and IgM and 99.4% for IgG, which limits the chances of false positive results.

IgM Detection - Immocapture vs Indirect ELISA

True Reaction

Others

ErbaLisa® Dengue IgM μ-Capture

Interference of IgG in other kits

Others

Microwells coated with Dengue antigens may cause **FALSE NEGATIVE**

ErbaLisa® Dengue IgM μ-Capture

Microwells coated with Anti-human IgM leads to **TRUE POSITIVE**

Interference of RF in other kits

Rheumatoid Factor is typically an IgM class antibody that recognizes Fc region of IgG antibodies.

Others

Binding of RF to IgG may cause **FALSE POSITIVE**

ErbaLisa® Dengue IgM μ-Capture

Use of Dengue antigen conjugate leads to **TRUE POSITIVE**
